The limit of “Super-Resolution”

Unbound theoretical resolution

$$D = \frac{d_{\text{Diffraction}}}{S}$$

- $S \approx \sqrt{N}$
- 6,000 photons for Cy5 → 5 nm

Fluorescent protein vs. Antibody

Fluorescent protein fusion

- Live sample labeling
- High specific
- High labelin
- Genetically
- Lower S/N
- Multicolor imaging so far challenging

Antibody immunofluorescence

- Fixed sample
- pecific labeling
- efficiency
- genous proteins
- igh localization
- More versatile for multicolor imaging

Newer labeling methods

- Enzymatic tags

  SNAP-tag, HALO-tag, TMP-tag, etc.

- Nanobodies
- RNA aptamers
